Crestron takeover review

Training Room A / Display replacement and new touch panel controls

BID DECISION

Price discovery separately.

The archive includes editable processor logic. Two missing files prevent a firm price for the requested panel changes and a reproducible processor build.

What the supplied files support

Processor source	RoomA.smw contains the display routing logic. The integrator can scope that part once the replacement display model and its control interface are confirmed.
Custom module	RoomA.smw references DisplayBridge.umc. The supplied archive omits it. Request the matching module revision before committing to a processor rebuild.
Touch panel	The archive contains RoomA.vtz, a compiled panel file. Request the matching editable VT Pro-e project (.vtp) before quoting changes to the existing interface.

Suggested bid language

“Our fixed price for implementation depends on receipt of the matching panel source and custom display module, confirmation of the installed revision, and a successful test build. If a file is unavailable, we will quote replacement work separately.”

Review boundary

This fictional example models an offline file review. Current site behavior, the loaded revisions and the result of a bench compile are unverified.
